Abstract for “The Methodological Innovations, Main Results and Findings of the 2011 Round of the International Comparison Program”

Nada Hamadeh (World Bank)
Michel Mouyelo-Katoula (World Bank)

The International Comparison Program (ICP) is a worldwide statistical initiative designed to estimate Purchasing Power Parities (PPPs) that can be used as currency converters to compare the performance of economies around the world. The ICP conducts surveys every five/six years to collect price and expenditure data for all goods and services that make up the Gross Domestic Product (GDP) in economies worldwide in order to calculate the PPPs. PPPs enable levels of economic activity in different countries to be compared thereby providing in-depth views of the distribution of resources worldwide. The 2011 round of the ICP was leveraged on the successful outcome of the 2005 round that included 146 economies. The 2011 round introduced various methodological improvements, mainly in linking the regions and aggregating results. The preliminary results from the 2011 round were released in December 2013, followed by a more comprehensive final report in March 2014. The December release provided PPPs, price level indices, and real expenditures for the GDP and major aggregates for over 190 countries. The final report in 2014 provided a more in-depth analysis of volume and per capita indices. The purpose of this paper is to provide an overview of major methodological innovations that were implemented in the 2011 ICP, and the main results and findings of the round.
